

Almex Belt Turnover

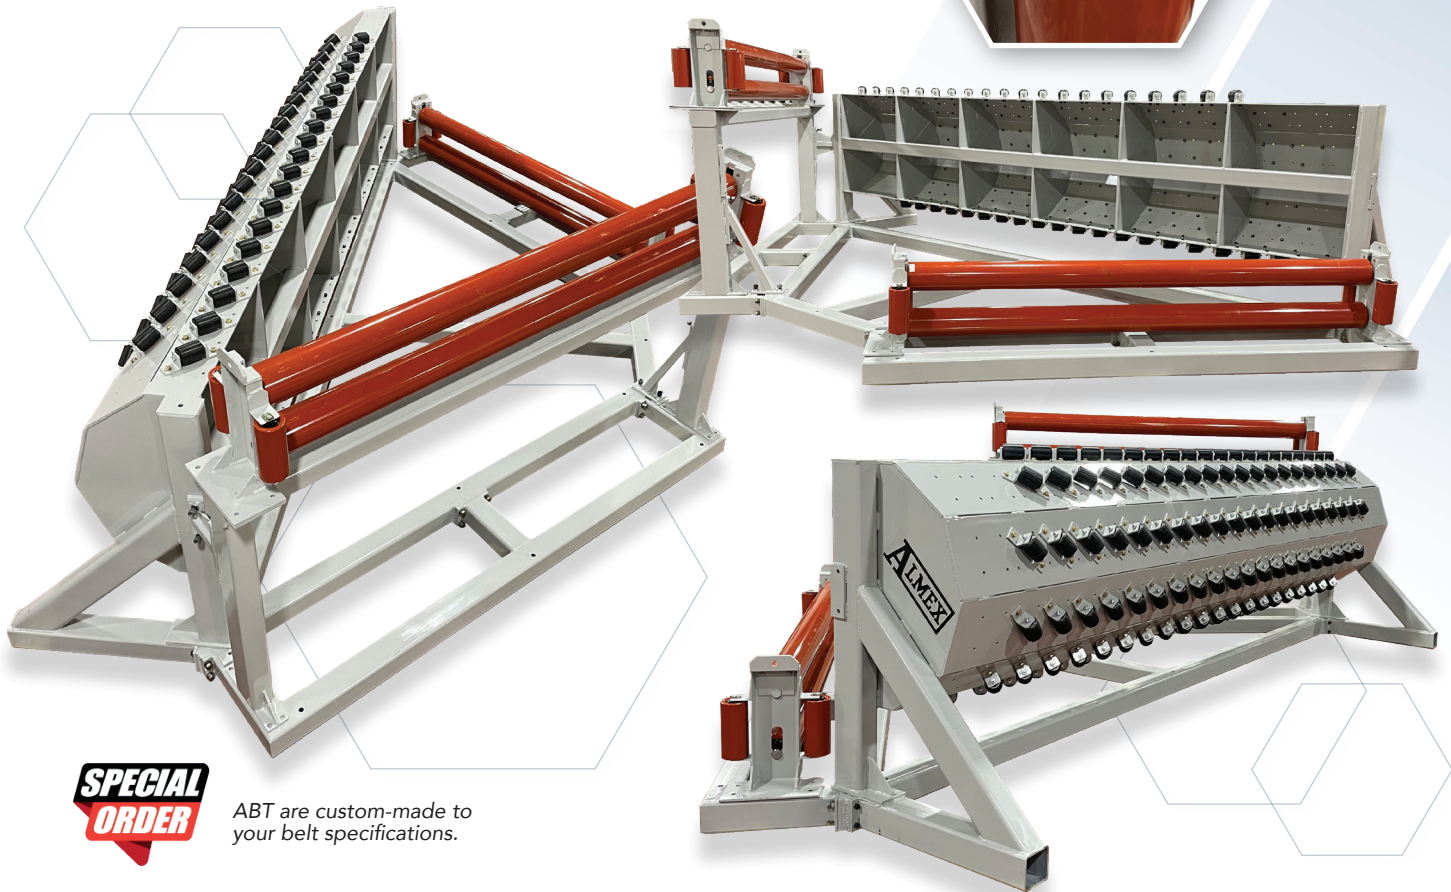

The **ABT** (Almex Belt Turnover) is a unique design to turn over and redirects the conveyor belt at a 90-degree angle.

Unlike conventional belt turners that twist the belt over a period of meters on the return side, the ABT supports the belt all the way through the turn with the assistance of casters.

Belt turnover extends the life of the belt and rollers, cleans the belt, and reduces the amount of maintenance needed for a belt.

■ OPTIONS:

- Reversible configuration
- Eliminate build up from belt and conveyor components
- Improves the conveyor belt lifespan

ABT are custom-made to your belt specifications.
